**GENERAL CHEMISTRY 2
THIRD HOUR EXAM**

Name _____

Panthersoft ID _____

Signature _____

Part 1 _____ (24 points)

Part 2 _____ (40 points)

Part 3 _____ (36 points)

TOTAL _____ (100 points)

Do all of the following problems. Show your work.

*******Unless otherwise stated, you may assume T = 25. °C*******

Part 1. Multiple choice. Circle the letter corresponding to the correct answer. There is one and only one correct answer per problem. [4 points each]

1) A 1.000 L sample of a buffer solution contains 0.100 moles of acetic acid (CH_3COOH), a weak acid, and 0.100 moles of sodium acetate (NaCH_3COO) a soluble ionic compound. 1.00 mL of a 1.00 M solution of sodium hydroxide (NaOH), a strong soluble base, is added to the solution. The pH of the solution

- a) will increase by a large amount (more than 0.50 pH units).
- b) will increase by a small amount (less than 0.10 pH units).
- c) will decrease by a large amount (more than 0.50 pH units).
- d) will decrease by a small amount (less than 0.10 pH units).
- e) will not change.

2) Potassium hydrogen phthalate (KHP, $M = 204.2 \text{ g/mol}$) is a weak monoprotic acid often used to find the concentrations of stock solutions of strong soluble bases. Consider the titration of a 1.5 g sample of KHP (dissolved in $\sim 25 \text{ mL}$ of water) with a stock solution of NaOH , a strong soluble base, whose concentration is approximately 0.10 M. Which of the following would be the best indicator for the titration?

- a) Thymol blue ($\text{pK}_a = 2.0$)
- b) Bromocresol blue ($\text{pK}_a = 4.5$)
- c) Bromthymol blue ($\text{pK}_a = 6.6$)
- d) o-Cresolphthalein ($\text{pK}_a = 9.0$)
- e) All of the above indicators would be equally good for finding the equivalence point for this titration

3) In which of the following buffer solutions will the molar solubility of copper II hydroxide ($\text{Cu}(\text{OH})_2$, $K_{\text{sp}} = 2.2 \times 10^{-20}$) be largest?

- a) A buffer solution at $\text{pH} = 5.0$
- b) A buffer solution at $\text{pH} = 7.0$
- c) A buffer solution at $\text{pH} = 9.0$
- d) A buffer solution at $\text{pH} = 11.0$
- e) The molar solubility will be the same in all of the above buffer solutions

4) Consider the reaction forming the complex ion $\text{Cu}(\text{CN})_4^{2-}(\text{aq})$

A system initially contains 0.100 M Cu^{2+} ion and 0.100 M CN^{-} ion at $T = 25. \text{ } ^\circ\text{C}$. At equilibrium

- a) the concentration of $\text{Cu}(\text{CN})_4^{2-}$ ion will be small (less than 10^{-4} M)
- b) the concentration of Cu^{2+} ion will be small (less than 10^{-4} M)
- c) the concentration of CN^{-} ion will be small (less than 10^{-4} M)
- d) Both b and c
- e) None of the ion concentrations will be small

5) For which of the following substances will the oxidation number for oxygen be equal to -2 ?

- a) OF_2
- b) H_2O
- c) H_2O_2
- d) Both b and c
- e) Both a and b and c

6) A reduction reaction takes place

- a) At the cathode of a galvanic cell
- b) At the anode of a galvanic cell
- c) At the anode of an electrolytic cell
- d) Both a and c
- e) Both b and c

Part 2. Short answer.

1) Define the following terms [4 points]

a) end point

b) oxidizing agent

2) The solubility of aluminum fluoride (AlF_3 , MW = 83.98 g/mole) is 5.59 g/L at $T = 25.^\circ\text{C}$. What is the value for K_{sp} , the solubility product, for AlF_3 ? [8 points]

3) A buffer contains significant amounts of hypobromous acid (HBrO), a weak acid, and sodium hypobromite (NaBrO), a soluble ionic compound. Write equations showing how this buffer neutralizes added strong acid (HCl) and added strong base (NaOH). [6 points]

4) What is the oxidation number for sulfur (S) in each of the following molecules or ions? [2 points each]

H₂S _____

S₂O₃²⁻ _____

H₂SO₃ _____

S₈ _____

5) Balance the following oxidation-reduction reaction for the indicated condition. [10 points each]

Part 3. Problems.

1) Nitrous acid (HNO_2 , $M = 47.02 \text{ g/mol}$) is a weak monoprotic acid, with $K_a = 4.6 \times 10^{-4}$ at $T = 25. \text{ }^\circ\text{C}$.

A student adds 4.04 g of potassium hydroxide (KOH , $M = 56.1 \text{ g/mol}$), a strong soluble base, to 500.0 mL of a 0.4268 M aqueous solution of nitrous acid. The addition of KOH causes no significant change in the volume of the solution.

a) Write the reaction that occurs when the KOH is added to the nitrous acid solution. [4 points]

b) What is the pH of the above solution after the addition of KOH ? [12 points]

c) Does the addition of the potassium hydroxide lead to the formation of a buffer solution (yes/no, and a justification for your answer)? [4 points]

2) Consider the following galvanic cell (at $T = 25. \text{ }^\circ\text{C}$)

Find the following. You may need to use some of the reduction data given below in doing part of this problem

a) The half cell oxidation reaction, the half cell reduction reaction, and the net cell reaction [6 points]

b) E°_{cell} [4 points]

c) E_{cell} [6 points]
